

## How to add Online Business Valuation's Calculator to Your Website

Adding Online Business Valuation calculator tool to your website is easy. You can either link to it directly, or “embed” it into a page on your website.

**LINK to the calculator.** You can create a simple link and it opens as a regular browser page (it can go to a separate page, or open in it's own window).

- Here is a LINK that shows how it looks orionally: [www.valuationdashboard.com](http://www.valuationdashboard.com)
- Here is a LINK that shows how it looks with a partner ID (note: the name has changed to “test partner”): [www.valuationdashboard.com/?partnerid=100400](http://www.valuationdashboard.com/?partnerid=100400)

**EMBED the calculator within your website.** Or, you can open it within a “window” on one of your own web pages—usually called an “iFrame.” Simply insert the following code below into the page where you would like it to appear (there are also sizing options available). Example shows it with size options (you can adjust as you prefer) and your Partner ID (copy everything within the < to >:

```
| <iframe src="https://valuationdashboard.com/?partnerid=100400" width="800" height="800"></iframe>
```

### Adding Your Partner ID

You should have already received your partner ID. If you have not, please request it from your partner manager. Your company name and contact information received during the application will be used to create an ID that displays your name in the calculate.

Replace the RED ID numbers with your own ID and it will be personalized and show your name and contact information.

### Advanced options

IGNORE if you are not techy. The traditional way to embed another webpage inside WordPress is by using the HTML attributes IFrame. To do this, simply take the URL of the page you want to embed, and use it as the source for the Tag. Then, your code becomes:

```
<iframe src =”your webpage url”>
```

Then, if you want you can add more parameters to your tag. You can define the window of the IFrame by using the params:

- **Width/Height**– For height and Width of the iFrame window, define values in Px
- **Frameborder** – For displaying or hiding the Frameborder, use values ‘0’ or ‘1.’

- **Align** – For defining the window’s page alignment, Use values “left” “right” “right” “top” “bottom.”
- **Scrolling** – For disabling or enabling Scrolling inside the Window. Use values “yes,” “no” or

Then simply paste your code into the **text editor** of your post on WordPress, and that should display your post easily. For example, we can just take the URL “https://valuationdashboard.com” and use it as our source. And build a tag for our embedded page. Then using the added attributes for customization, we get:

```
<iFrame src = “http://valuationdashboard/?partnerid=100400“ width= “600” height=”800”  
frameborder =”1” scrolling = “yes” align = “left”></iFrame>
```
